

# Project Proposal- Art2Story

## Project Title:

Art2Story: Generating Stories from Visual Art Using Pre-trained Models

## Group Members:

- Ali Hasan – BSDSF21A011
- Ahmed Faisal – BSDSF21A034

## 1. Introduction:

Every piece of art carries a story—whether it's a painting, sketch, or abstract design. This project aims to bring those stories to life using artificial intelligence. We propose to build a system that takes an image of any artwork and generates a short story based on what's visually present in the piece.

## 2. Objective:

The goal is to design a creative application that interprets artwork using pre-trained AI models. By identifying the contents of the art and generating related narratives, the system will offer a unique storytelling experience.

## 3. Real-World Relevance:

This tool can be used in areas like education, creative writing, art galleries, and digital entertainment. It allows artists and audiences to explore alternate meanings and stories behind visual creations.

#### 4. Project Scope:

1. Accept images of any form of artwork
2. Describe what's present in the image
3. Generate a story inspired by the description using pre-trained language models

#### 5. Conclusion:

Art2Story is a creative and practical project that connects art and storytelling through AI. It invites users to explore the narratives hidden within visual expression in a new and imaginative way.
